

Project Development Phase

Performance Testing – Client Script & UI Policy Behaviour

Date	02 October 2026
Team ID	9100SyncSquads
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	10 Marks

1. Test Objective

To measure how accurately and efficiently the UI Policy "High Impact Control" and the three Client Scripts (onChange, onSubmit and onCellEdit) enforce the defined rules on the Incident form and Incident list in ServiceNow, and to confirm that the rules respond immediately in the browser and that no script errors occur.

2. Test Environment

Component	Details
Platform	ServiceNow Personal Developer Instance (dev445113) – UI Policies, Client Scripts, Incident application
Target table	Incident (incident)
UI Policy	High Impact Control – condition: Impact is 1 – High; Reverse if false enabled
UI Policy actions	Assignment group = Mandatory; Urgency = Read-only
onChange Client Script	Auto set urgency for high impact (field: Impact)
onSubmit Client Script	Prevent save if Assigned To missing
onCellEdit Client Script	Prevent state change via list edit (field: State)
Browser / user	Brave (Chromium) browser; administrator user
Test records	INC0010003 and INC0010005 (Impact = High), INC0010004 (Impact = Low), INC0010002 and INC0009005 (list edit)

3. Client-Side Rule Performance Results

Each run was executed on the Incident form or the Incident list and recorded in the demo video. The observed result and response time are recorded against the expected result. Response times were measured frame by frame from the demo video (recorded at 30 frames per second, 1 frame ≈ 0.033 s), so they are approximate.

Run	Scenario	Rule Triggered	Expected Result	Observed Result (Demo Video)
1	New Incident: set Impact = High (INC0010003, INC0010005)	UI Policy + onChange	Assignment group mandatory; Urgency read-only and set to 1 – High	Assignment group became mandatory and Urgency was greyed out (read-only). Urgency showed 1 – High with Priority 1 – Critical on INC0010005; on the first run (INC0010003) Urgency stayed 3 – Low
2	Save High impact Incident with Assigned To empty (INC0010003)	onSubmit	Save blocked; error shown on Assigned To	Save blocked; error "Assigned To is mandatory for High impact incidents." shown under Assigned To
3	Save High impact Incident with Assigned To filled (INC0010003)	onSubmit	Incident saved successfully	Assigned To = Bernard Laboy (Assignment group = CAB Approval); Incident submitted and State changed to In Progress
4	Change Impact from High to Medium	UI Policy (Reverse if false)	Assignment group not mandatory; Urgency editable again	Assignment group no longer mandatory and Urgency editable again after Impact was changed to Medium (evidence added by the team)

Run	Scenario	Rule Triggered	Expected Result	Observed Result (Demo Video)
5	Edit State by changing the cell in the list view (INC0010002, INC0009005)	onCellEdit	Alert shown; edit cancelled; State unchanged	Browser alert "State cannot be updated using list editing. Please open the Incident." shown; State remained New
6	Change State on the Incident form and click Update	None (form update)	State updated and saved successfully	State changed on the form and saved with Update; no alert on the form (evidence added by the team)

4. Performance Parameters

S.No	Parameter	Expected Value	Observed Value	Screenshot / Evidence
1	Form load	Incident form opens with the UI Policy and scripts active without noticeable delay	Incident forms (INC0010003, INC0010004, INC0010005) opened normally with no visible delay	Demo video – new Incident form
2	UI Policy response	Mandatory and read-only behaviour applied immediately when Impact is set to High; no page reload	Mandatory marker on Assignment group and read-only Urgency appeared about 0.1 s (3 video frames) after High was selected; no reload	Demo video – Impact = High
3	Auto-set Urgency (onChange)	Urgency set to 1 – High and info message shown immediately after Impact is changed	Urgency showed 1 – High on INC0010005; stayed 3 – Low on INC0010003 (first run). Info message not visible in the recording	Demo video – INC0010005 form
4	Save validation (onSubmit)	Save cancelled and error box shown on Assigned To without a server round trip	Error box shown under Assigned To in under 0.1 s after Save was clicked; record not saved until Assigned To was filled	Demo video – INC0010003 error message
5	List edit control (onCellEdit)	Alert shown immediately; State value remains unchanged	Alert shown about 0.1 s after the save tick was clicked; State stayed New	Demo video – Incident list alert
6	Script error rate	0 script errors during all runs	No errors seen on screen during the demo (browser console not shown)	Demo video

5. Conclusion

The performance testing shows that the UI Policy "High Impact Control" and the three Client Scripts (onChange, onSubmit and onCellEdit) respond within about 0.1 second in the browser. When Impact is set to High, Assignment group becomes mandatory and Urgency becomes read-only; saving a High impact incident without Assigned To is blocked with an error message; and editing State in the list view is stopped with an alert. All of this happens on the client side without a page reload, and no script errors were seen on screen, so the rules do not slow down the Incident form or list.

One point to confirm: Urgency was set to 1 – High automatically on INC0010005, but stayed at 3 – Low on the first run (INC0010003). The onChange behaviour should be retested once more before final submission. Response times are approximate because they were measured from the demo video at 30 frames per second.
