

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	30 September 2026
Team ID	
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Conditional Field Control (UI Policy)	Create UI Policy 'High Impact Control' on Incident when Impact is 1 - High Make Assignment group mandatory Make Urgency read-only using a UI Policy Action Reverse if false, so changes revert when Impact is not High
FR-2	Automatic Field Update (onChange Client Script)	Auto set Urgency to High when Impact is changed to High Display info message 'Urgency set to High for High impact incident.'
FR-3	Save-Time Validation (onSubmit Client Script)	Prevent save when Impact is High and Assigned To is empty Show error message on the Assigned To field
FR-4	List Edit Restriction (onCellEdit Client Script)	Block State changes made directly in the list view Show alert asking the user to open the Incident
FR-5	Testing the Configuration	Test mandatory enforcement Test successful save Reverse condition test (High to Medium) Test list edit blocking Test form-based State update

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Rules run directly on the Incident form, so users get immediate field changes and clear error, info and alert messages without extra training.
NFR-2	Security	Rules are configurable only by users with administrative access; mandatory fields and save validation stop incomplete High impact Incidents, and State cannot be changed from the list. These client-side rules complement the platform's server-side security.

NFR-3	Reliability	The same rules run every time an Incident is opened, changed or saved; Reverse if false restores fields automatically when Impact is no longer High.
NFR-4	Performance	Client scripts run in the browser without a server round trip and exit early when the form is loading or the value is empty, so form load and save time are not noticeably affected.
NFR-5	Availability	Rules are part of the ServiceNow instance, so they are available whenever the instance is available and need no extra servers or services.
NFR-6	Scalability	The UI Policy and Client Script pattern applies to all Incident records and users and can be reused for other fields or tables by adding new policies or scripts.
